ABRIDGED LIFE TABLES, MALAYSIA, 2019-2021

INTRODUCTION

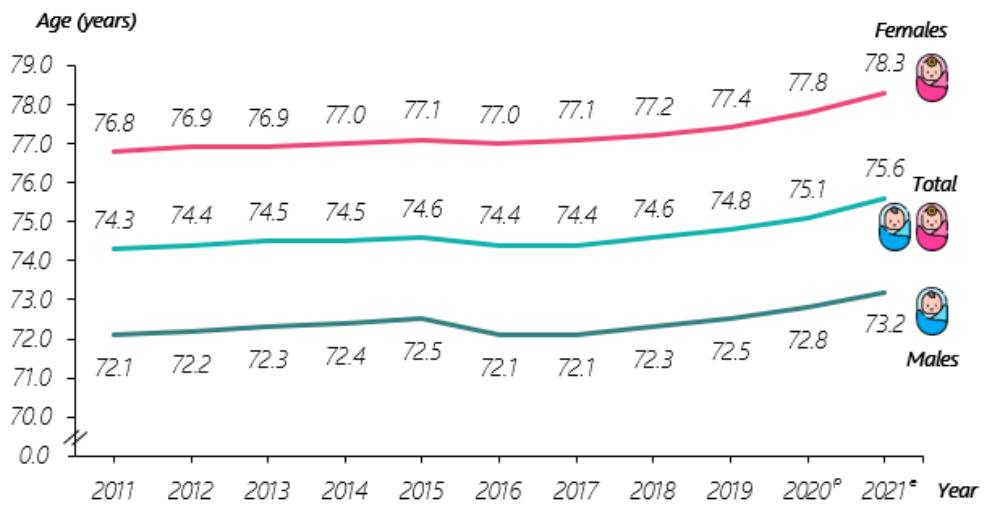

- The Abridged Life Tables, Malaysia, 2019-2021 presents life tables by age, ethnic group and sex. These life tables are generated based on the mortality statistics for the three-year period and mid-year population estimates of Malaysia.
- Life table is a table that shows the probability that a person at a certain age will die before reaching his or her next birthday. A life table is prepared from age-specific mortality rates and the derived values are used to measure mortality, survival ratio and life expectancy.
- The average remaining age (years) for a person is expected to live at the beginning of a certain age if the age-specific death rates of the given period continued throughout his or her lifetime.

LIFE EXPECTANCY AT BIRTH

Life Expectancy at Birth Increased by 1.3 Years A Decade Ago

Baby born in 2021 on average is expected to live 1.3 years longer to 75.6 years old as compared to 74.3 years old in 2011. On average, a newborn girl is expected to live longer up to 78.3 years, while a newborn boy is expected to live until 73.2 years in 2021. From 2011 through 2021, life expectancy at birth for males has increased by 1.1 years, from 72.1 years old (2011) to 73.2 years old (2021), while females increased by 1.5 years as compared to 76.8 years old for the same period.
